ON THE
MEAN TEMPERATURE OF EVERY
DAY, MONTH, AND YEAR

FROM ALL
THERMOMETRICAL OBSERVATIONS

TAKEN AT THE
HORTICULTURAL GARDENS
AT
CHISWICK

FROM THE BEGINNING OF 1826 TO THE END OF 1869

TEMPERATURE.

On the 28th of February in the year 1825, the Garden Committee of the Royal Horticultural Society resolved that it was expedient that a meteorological Journal should be kept at Chiswick in the gardens of the Society; and observations were commenced on the 1st of May, but from the difficulties experienced in obtaining efficient instruments and the circumstances the observations to the end of the year were not considered to be sufficiently perfect for publication.

From the 1st day of January 1826 to the 31st day of December 1869, however, the observations were made upon one uniform plan throughout; till June 1830 by Mr. William Beattie Booth, A.L.S., and from that date, with but few exceptions which are not specified, by Mr. Robert Thompson, under-gardener in the fruit department.

The observations during the whole of this period of 44 years have been made at three different times in the day, designated in the journals as morning, noon, and night; and included the readings of the barometer, temperature of the air and either a Daniell's hygrometer or a wettened-bulb thermometer as well as maximum and minimum temperatures with solar and terrestrial readings, fall of rain, direction and strength of the wind by estimation, and brief notes.

The morning observations are stated to have been made at 6 o'clock in the summer months, and at daybreak in the winter months; the noon observation was made between noon and 1 P.M., and the night observation between the hours of 9 P.M. and 10 P.M.

In the reduction of the observations I have considered the morning observation to have been made at 6 o'clock A.M. in the months of April to August; at 6.30 A.M. in the months of March, September and October; at 7 A.M. in the months of February and November; and at 8 A.M. in the months of January and December; that the noon observations have been made midway between noon and 1 P.M., and the night observations at 9.30 P.M. throughout the year.

Considering that temperature is the most important meteorological element bearing upon all animal and vegetable life, and also considering that the science of open-air horticulture needs a full knowledge of the

extremes and means of climatic temperature; the horticulturist has to contend with so great a difference in the distribution of temperature at the same season in different years, that it is of the first importance to determine accurately the average of temperature of every day in the year, with the extremes to which it is liable. It is known that the disturbance of the animal economy takes place when the mean temperature of the air is that of the average of the season, and the greatest disturbances take place whenever the temperature of the air departs the greatest, either above or below that average; and there is no doubt that the same general law affects all vegetation in a similar manner, and that the effect follows the cause after an interval of time. It was these considerations which induced me to confine my first reaction to this long series of observations to temperature alone.

The instruments used were:—

A Daniell's hygrometer, and maximum and minimum thermometers of Rutherford's construction made by Newman. (These thermometers were placed in an open spot in the Arboretum, screened from the rays of the sun and sheltered from radiation by a kind of umbrella of black cloth; they were attached to the northern side of the post which supported the umbrella, and are four feet above the ground.—See page Vol. vii. *Trans. Hort. Soc.*)

There is no record of change of instruments. The scale used was that of Fahrenheit, except in the years 1835, 1836, and 1837, when the centigrade scale was used.

Till the year 1844 there are no MSS. observations, but the observations are published *in extenso* in the *Transactions of the Royal Horticultural Society*. From the year 1845 the observations are in MSS.

The first process in the reduction of the observations was to go day by day, to see that the several thermometrical observations in the day were less than the maximum and greater than the minimum, and to note all discordant readings.

The second step was to examine these discordant readings for the purpose of ascertaining the cause of the error. On that day were consulted, for readings taken at about the same time, and to determine the general course of increasing and decreasing readings, and amount of change. A great many errors were found, principally in the readings of the minimum thermometer.

The third process was to take the daily sums and means of the observations of morning, noon, and night temperatures, for a first approximation of mean daily temperature.

The fourth was to take the daily sums and means of the maximum and minimum temperatures, for a second approximation to the mean daily temperature.

The method was to take the daily differences between the maximum and minimum temperatures, for daily range. Next to deduce from each of these approximate true mean daily values, by the application of corrections as calculated from my Tables of Diurnal Range. The corrections to be applied to the mean of the three daily observations were as follows (dependent on the time of the year, the times of observation, and the daily range of temperature):—

In January	when the daily range was	7	the correction was	
			0	0
				subtractive

These corrections were applied daily to the mean of the three daily observations to determine the true mean daily temperature throughout the whole times, excepting the three years when the centigrade scale was unfortunately used. I say unfortunately, for the observations were made to the whole degree only, and thus the error of reading was frequently as large as 1° Fah. A mean correction belonging to each

month was thought sufficient during these three years. The process was to apply a correction daily to the mean of the maximum and minimum temperatures, dependent upon the time of year; deduce from these a second approximation to the true mean daily temperature, and which corrections are as follows:—

From January	1 to January	7 the correction was	0.1 subtractive

By the application of these numbers a second mean daily temperature was formed.

The next process was to compare the daily results deduced from the three observations with that found from the maximum and minimum

temperatures—the two results should be alike, or nearly so; and when it was not the case, to note all instances of discordance.

Then to examine a second time all Greenwich records on those days, to trace the source of discordance; the errors thus found were mostly belonging to the morning or noon observations.

The last step was to combine the results found by the two methods together, for the determination of the most probable mean temperature of every day, as found from all the observations taken that day, and in this way Tables I. to XII. were formed.

The numbers in the first column are the days of the month, those in the following forty-four are the mean temperatures of the same day of the month in the successive years; the forty-sixth column contains the mean temperature of every day, as deduced from the forty-four years observations, and each value, therefore, is based upon about 220 observations, spread equally over the period. The remaining columns contain the highest and lowest mean daily temperatures within the periods, and in the last column the difference between them.

The numbers in the bottom line are the means of all the numbers in the columns above them, and therefore are the mean temperatures of each month; each result is based upon 150 observations nearly; the whole number of observations treated of in this paper exceed 80,000.

TABLE I. Mean Temperature of every day in the month of January, as deduced from the observations taken on that day at the Gardens of the Royal Horticultural Society at Chiswick in the years 1826-1869;
and extremes of Mean Temperature for every day within the same period.

DIAGRAM showing the Mean Temperature of the Air for every day in the year, from observations made, from January 1, 1826, to December 31, 1869, at the Gardens of the Royal Horticultural Society at Chiswick.

By examining the numbers in the forty-sixth column, it will be seen that there are many large differences between the values on consecutive days.

By laying these down on a diagram all these are shown, and by drawing a curved line to pass through or near all these points, giving equal weight to every one, the most probable temperature of every day of the year is shown. The numbers in Table XIII. are the best I can decide upon as the nearest approximation to the true temperature belonging to every day in the year.

The days of the lowest mean temperature ($36^{\circ}\cdot3$) are January 7th, 8th and 9th; it then *increases* to $39^{\circ}\cdot3$ on the 4th of February, remains stationary at that temperature till the 8th, and then gradually *decreases* to $39^{\circ}\cdot0$ on the 13th and three following days; from the 16th it *increases*, and continues so to do, gradually for the first few days, but towards the end of March at a more rapid rate, the mean temperatures of consecutive days differing as much as two or three-tenths of a degree from each other, and continues increasing at this rate till the 8th of June, when it slackens to a general rate of one-tenth, but still increases till we arrive at July 9th, the mean temperature of this day differing from that of the 26th of the same month by one-tenth of a degree only; then begins to *decrease*, gradually till the 11th of August, and at a more rapid rate from that date, decreasing uninterruptedly till the 1st of November, from which day till the 9th of December, when the change is very small, the mean temperature being unchanged for three or four days together, it then continues to decrease until the end of the year.

TABLE XIII.

Showing the adopted Mean Temperature of every day in the year as determined from all the Thermometrical Observations taken at the Gardens of the Royal Horticultural Society, Chiswick.

From the numbers in this table we learn that the coldest month in the year has taken place in January 26 times, in February 8 times, December 8 times, in March once, and in November once. These unusual circumstances took place in the years 1837 and 1851 respectively.

The hottest month has occurred twice in June, 27 times in July, and 15 times in August.

The month of lowest temperature was January 1838; and of highest was July 1852.

By taking the mean of all the values for each month, we find :—

The mean temperature of January	was	37·4
„ „ February	„	39·4
„ „ March	„	42·4
„ „ April	„	48·2
„ „ May	„	51·4
„ „ June	„	60·5
„ „ July	„	63·1
„ „ August	„	62·2
„ „ September	„	57·6
„ „ October	„	50·4
„ „ November	„	42·7
„ „ December	„	40·0

And the mean of these gives 49°·9 as the mean yearly temperature.

By taking the means of the numbers in each horizontal line, the mean temperature for each year is determined as follows :—

TABLE. XV.—*Mean Temperature of every Year, 1826–1869.*

YEARS	MEAN TEMPERATURES	YEARS	MEAN TEMPERATURES	YEARS	MEAN TEMPERATURES
1826	51·4	1841	49·8	1856	49·2
1827	51·0	1842	50·5	1857	51·0
1828	52·2	1843	50·3	1858	49·4
1829	47·9	1844	49·4	1859	50·5
1830	49·8	1845	48·0	1860	47·1
1831	52·1	1846	51·7	1861	49·2
1832	50·1	1847	49·7	1862	50·0
1833	50·4	1848	50·1	1863	50·9
1834	52·2	1849	50·1	1864	48·6
1835	50·6	1850	48·9	1865	50·2
1836	49·5	1851	49·7	1866	50·4
1837	48·8	1852	50·9	1867	49·2
1838	47·8	1853	48·1	1868	52·3
1839	49·8	1854	49·2	1869	50·0
1840	48·9	1855	47·2		

and the mean of all these is $49^{\circ}\cdot 9$, as the mean temperature of the year—being of the same value as found from the monthly results.

The mean temperatures of the years 1828, 1831, 1834, and 1868, are all above 52° . The year of highest temperature was 1868, and its value was $52^{\circ}\cdot 3$.

The mean temperatures of the years 1829, 1838, 1855, and 1860, are all below 48° . The year of lowest temperature was 1860, and its value was $47^{\circ}\cdot 1$.

Thus 44 years, from 1826 to 1869 inclusive, give a mean temperature of $49^{\circ}\cdot 9$, with a variation, between one year and another, from $^{\circ}\cdot 1$ in 1860 to $52^{\circ}\cdot 3$ in 1868. The difference is $5^{\circ}\cdot 2$.

IN the preceding Tables I. to XII., the mean temperature of the air is shown for every day in 44 years, and in the forty-sixth column of these Tables the mean temperature of every day is determined. By taking the differences between the mean temperature of every day, from the average of the same day as found from all the years, the excess or deficiency of every day is shown; and in this way Tables XVI. to XXVII. were formed, those days of excess of temperature being distinguished by the sign *plus* (+), and those of defect of temperature being denoted by the sign *minus* (—).

A glance at these Tables shows that the differences from day to day are very great, and that the temperature of the same day is very different in different years. At times it will be seen there have been long periods together with one or other sign prevailing, but that there have been but few months in which on every day of the month it has been either always above or below the average; the only instances are February 1853, July 1857, and August 1860, during which months every day was cold and of lower temperature than the average; and October 1831, in which every day was warm and of higher temperature than the average. There are, however, a few having but one with either a + or — sign and all the remainder affected with the opposite sign; they are:—

January,	1830 and 1834
February,	1855
April,	1844
June,	1860
November,	1851
December,	1852

In every other month there have been two or more days with different signs. It will thus be seen how very rarely every day of a month has been wholly of high or wholly of low temperature. This will be more clearly shown by the following Table:—

TABLE XXVIII.

Showing the Greatest Daily Excess and Deficiency in each Month of the Years 1826-69.

On looking over this Table the first thing that strikes one is that the largest numbers are those generally under the — sign, and particularly so in the months of winter. There are but four blanks in the Table, *viz.*, February 1853, July and August 1860, and October 1831, showing, as before, that these are the only four months of our temperature throughout, three being cold and one warm.

By picking out under each month the largest number with a + sign and the largest number with a — sign, the extreme departures in each month in 44 years will be shown, and are as follows:—

In January the greatest excess on any one day was 16°0 in the year 1828				
„ February	„	„	16°9	„ 1831
„ March	„	„	14°7	„ 1826
„ April	„	„	16°1	„ 1828
„ May	„	„	17°6	„ 1847
„ June	„	„	16°7	„ 1858
„ July	„	„	15°4	„ 1868
„ August	„	„	14°5	„ 1842
„ September	„	„	12°1	„ 1865
„ October	„	„	11°9	„ 1831
„ November	„	„	15°9	„ 1852
„ December	„	„	13°9	„ 1856

And

In January the greatest deficiency on any one day was 29°6 in the year 1838				
„ February	„	„	22°4	„ 1855
„ March	„	„	22°3	„ 1845
„ April	„	„	16°8	„ 1861
„ May	„	„	16°5	„ 1867
„ June	„	„	27°2	„ 1869
„ July	„	„	16°2	„ 1856
„ August	„	„	12°1	„ 1867
„ September	„	„	12°1	„ 1860
„ October	„	„	18°6	„ 1859
„ November	„	„	21°5	„ 1858
„ December	„	„	20°5	„ 1844

In every month, with the exception of May and August, the extreme deficiency of temperature is larger than the extreme excess, and very largely so in many months.

The greatest excess of temperature during the 44 years was 17°; this took place on May 28, 1847; and the greatest deficiency was 29°, on January 20, 1838.

These extremes of temperature affect vegetation greatly, but they seldom occur alone; it is very necessary for the operations of open-air horticulturists to know for what lengthened periods these departures from averages may extend. By looking over Tables XVI. to XXVII.,

will be seen that very often there are long groups of + or — quantities, and that frequently several of the numbers are very large to which these signs are attached; and it is the accumulation of these departures, more than in isolated cases, which requires the attention of the horticulturist. These periods are variable in length, frequently of a week's duration, and less frequently of a fortnight; taking the latter as a limit, the following numbers show all the periods of excess of 14 days' or more than 14 days' continuance.

By taking the periods of excess above the average in each month, in which the number of days extend to 14 or more, and entering them opposite the month in which the period commences, we have the following:—

During the 44 years there were periods of deficiency of temperature of a fortnight or more in duration, beginning

In January there are 12 times

" February	" 7 "
" March	" 5 "
" April	" 8 "
" May	" 1 "
" June	" 7 "

In July there are 8 times

" August	" 5 "
" September	" 7 "
" October	" 2 "
" November	" 10 "
" December	" 8 "

or 80 instances in all, being 14 less in number than in similar periods of excess of temperature.

From the above groups we find that the largest periods of excess and deficiency above or below the average in each month are as follows:—

In January, of excess 26 days in 1846; and of deficiency 43 days in 1855

" February	" " 26 "	1867	" " 27 "	1858
" March	" " 28 "	1841	" " 45 "	1837
" April	" " 37 "	1844	" " 20 "	1860
" May	" " 25 "	1833 and 46	" 29 "	1860
" June	" " 24 "	1859	" " 75 "	1860
" July	" " 27 "	1852	" " 31 "	1860
" August	" " 24 "	1826	" " 31 "	1860
" September	" " 41 "	1831	" " 22 "	1829
" October	" " 24 "	1852	" " 22 "	1842
" November	" " 21 "	1831	" " 27 "	1844
" December	" " 46 "	1833 and 52	" 41 "	1860

Thus the longest period of excess above the average is 46 days, both beginning in December, in 1833 and 1852; and the longest period of deficiency below the average is 75 days, beginning in June 1860.

By taking the algebraical means of the values in each column of Tables XVI. to XXVII., the following Table was formed.

By looking over this Table at the general distribution of the + and signs, the most remarkable fact is the preponderance of + signs in the month of January, towards the end of the series, over those at the

TABLE XXIX.

beginning of the series; it is a fact well worthy the thoughtful attention of all horticulturists; the same thing is also shown in February, but to a less degree. Then, on the contrary, in the months of May, June, and July, the + signs seem to be more frequent at the beginning of the series than towards the end; particularly this is shown in the month of July, implying that our winter months are somewhat warmer, and our summer months somewhat colder, than formerly.

It will be seen that the same months have frequently been either above or below the average for three or four years in succession.

By selecting under each month the largest number with the + sign and the largest number with the - sign, the warmest and coldest of the several months are shown, and are as follows:—

In January the greatest excess was 8°·2 in 1834, and greatest deficiency was 8°·6 in 1855					
„ February	„	„	5·8 „ 1869	„	„ 10·6 „ 1855
„ March	„	„	6·1 „ 1830	„	„ 5·6 „ 1869
„ April	„	„	4·6 „ 1865	„	„ 6·1 „ 1855
„ May	„	„	6·6 „ 1833	„	„ 4·9 „ 1869
„ June	„	„	6·3 „ 1846	„	„ 5·2 „ 1869
„ July	„	„	5·6 „ 1868	„	„ 4·5 „ 1869
„ August	„	„	5·0 „ 1842	„	„ 4·0 „ 1869
„ September	„	„	5·1 „ 1865	„	„ 4·3 „ 1869
„ October	„	„	6·5 „ 1831	„	„ 5·0 „ 1869
„ November	„	„	5·8 „ 1852	„	„ 5·6 „ 1869
„ December	„	„	7·2 „ 1852	„	„ 7·6 „ 1869

Therefore the largest monthly excess of temperature was 8°·2 in January 1834, and the largest deficiency was 10°·6 in February 1855.

By taking the means of the numbers in each horizontal line in Table XXIX., the departure from the average of each year's temperature will be shown, divided into two groups of warm and cold years, and are as follows:—

Warm Years		Cold Years	
In 1826 too high by 1°·5		In 1829 too low by 2°·0	
„ 1827	„ 1·1	„ 1836	„ 0·5
„ 1828	„ 2·3	„ 1837	„ 1·1
„ 1830	„ 0·1	„ 1838	„ 2·1
„ 1831	„ 2·2	„ 1840	„ 1·0
„ 1832	„ 0·2	„ 1841	„ 0·1
„ 1833	„ 0·5	„ 1844	„ 0·4
„ 1834	„ 2·3	„ 1845	„ 1·8
„ 1835	„ 0·7	„ 1847	„ 0·2
„ 1842	„ 0·7	„ 1850	„ 0·9
„ 1843	„ 0·4	„ 1851	„ 0·2
„ 1846	„ 1·8	„ 1853	„ 1·8
„ 1848	„ 0·2	„ 1854	„ 0·6

Warm Years

In 1849 too high by	0°2
„ 1852 „	1°0
„ 1857 „	1°1
„ 1859 „	0°7
„ 1862 „	0°1
„ 1863 „	1°0
„ 1865 „	0°4
„ 1866 „	0°5
„ 1868 „	2°4
„ 1869 „	0°1

Cold Years

In 1855 too low by	2°7
„ 1856 „	0°7
„ 1858 „	0°5
„ 1860 „	2°8
„ 1861 „	0°6
„ 1864 „	1°2
„ 1867 „	0°7

The year 1839 was of the average temperature.

The warm years 1828, 1831, 1834, and 1868 were all $2^{\circ}\frac{1}{4}$ above the average: the year of greatest excess was 1868.

The cold years 1829, 1838, 1855, and 1860 were from $2^{\circ}\cdot 0$ to $2^{\circ}\cdot 8$ below the average: the year of greatest deficiency was 1860.

Thus in 44 years, the temperature of 23 have been above; 20 below, and one of the average value.

It is remarkable that from 1826 to 1835, with the single exception of 1829, every year was above the average; and those from 1836 to 1841, with the exception of 1839, which was just the average, all were below; and since then the only group of four or five years together of the same character in this respect were those from 1850 to 1856 (with the exception of 1852), which were below their averages. Since the year 1856, warm and cold years have been almost alternate.

CHISWICK
FROM THE YEAR 1826 TO THE END OF 1869

DAILY RANGES OF TEMPERATURE.

It is found that animal life is best preserved when the temperature of each season is that of its average, and when the range of temperature is also that of the average, and that sickness and death follow any great departure from these averages.

The occasional destruction of shrubs and fruit-trees by the cold of winter is very distressing and very annoying, and this sometimes takes place when the mean temperature of the air is the same as the plant has previously endured without injury; but the mean temperature of a period does not represent the actual temperature to which the plant has been subjected. The mean temperature may be based upon a range of temperature corresponding to the average, or it may be from one much smaller or much larger than the average; and in the latter case the plant is subjected to the injurious effect of alternate very high and very low temperatures, and in winter time this would imply a period, and perhaps a long one, in which the temperature was below 32° Fahr.

It is very important that the agriculturist and out-door horticulturist should know the ranges of temperature to which plants are exposed in the open air. This variation of temperature differs day by day and month by month; and it is only after a long series of observations that we are able to determine the average daily range in every season. The readings of the maximum and minimum thermometers have been taken continuously at Chiswick since 1826, and the difference between these values gives the range of temperature on each day throughout the period comprised between the years 1826-1869. Collecting these month by month and arranging them in parallel columns for different years, we have at one opening the ranges of temperature on every day throughout that month for the whole forty-four years, and thus Tables XX. to XLI. were formed.

Looking over the numbers in these Tables we see that in any month the range may be as small as 1° to 5° , and as large as from 30° to 40° in the winter months, and exceeding 40° by several degrees in the summer months. That frequently several days of small range come together, indicative of so many days of cloudy skies; and several days of larger range come together, indicating periods of clear skies.

By looking at the numbers on the same horizontal line, or the daily ranges of temperature on the same day of the month in different years, similar large differences appear; for instance on January 1 in the year 1837 the range was 23° , whilst in 1851 and 1859 on the same day of the year it was 3° only. Great varieties are thus shown on every day by comparing the results of different years together, or the numbers on the same horizontal line in the several Tables.

These results, being dependent on the different directions of the wind, the more or less cloudy state of the sky, and the different conditions of the weather generally, are as variable as the weather itself.

The maximum and minimum temperatures from which these results have been obtained are not given in these series of Tables, but they may be found approximately on any day by adding one-half of the range to the mean temperature of the same day, Table I. to XII., for the maximum, and by subtracting one-half of the range from the mean temperature for the day for the minimum.

By selecting the smallest and largest range in each month in all the years Table XLII. has been formed.

This Table shows very clearly how variable the range of temperature may be in twenty-four hours, and how very different in different years.

For instance, in the month of January under 'greatest' in the year 1833, the largest range in any one day was 15° , whilst in general it exceeds 20° , and in some years it has been as large as 30° . On the contrary, under 'least' in the years 1828 and 1854 the range has been as small as 1° , and by looking down the column it will be seen that ranges as small as 2° or 3° are common, whilst in other years there has been a range less than 8° or 9° . As small daily ranges have taken place in January and December, as 1° ; in February and November as 2° ; in March, April, and October as 3° , in June and September as 4° ; and in July and August as 5° . As large daily ranges as 32° have taken place in the months of January and December; of 34° in November; of 38° in February; of 39° in March; of 42° in June and October; of 44° in May; of 45° in July; of 48° in April, and one of 49° in August 1861, which is the largest in the Table.

By taking the mean of all the daily ranges in each year, or the mean of the numbers in every vertical column in Tables XXX. to XLII., Table XLIII. is formed.

From these numbers we see that the mean monthly daily range of temperature has varied

TABLE XXX. *Ranges of Temperature on every day in the month of January, as deduced from the observations taken on that day at the Gardens of the Royal Horticultural Society at Chiswick in the years 1826-1869.*

DAY OF THE MONTH	J A N U A R Y.

„ September,	„	16·1	„ 1827	„	31·2	„ 1865
„ October,	„	13·6	„ 1838	„	24·1	„ 1861
„ November,	„	11·0	„ 1835	„	20·3	„ 1861
„ December,	„	8·1	„ 1844	„	16·5	„ 1861.

Mean daily ranges, differing so greatly in each month, may well be attended with different agricultural and horticultural results.

The numbers in the bottom line show the average daily range in each month; and by taking the difference between these numbers and those in each year, the departure from the average will be found.

The gradual increasing numbers, from January 12°·2 to July 23°·5, and the gradual decrease month by month to December 12°·2, the same as January, indicates the annual law of daily range of temperature.

By taking the mean of all the daily ranges on the same day of the year from all the years, or the means of the numbers in every horizontal line in Tables XXX. to XLI. Table XLIV. was formed.

By selecting the least and greatest of these mean values in each month we find that the mean daily range of temperature has varied

In January,	from	9 ⁰ ·7	on the 11th day	to	15 ⁰ ·0	on the 29th
„ February,	„	12·4	„ 2nd	„	16·4	„ 17th
„ March,	„	13·6	„ 2nd	„	20·4	„ 31st
„ April,	„	18·4	„ { 9th and 12th }	„	23·5	„ 20th
„ May,	„	20·9	„ 1st	„	24·6	„ 17th
„ June,	„	21·2	„ 7th	„	25·3	„ 23rd
„ July,	„	20·9	„ 24th	„	26·8	„ 5th
„ August,	„	20·9	„ 6th	„	24·7	„ 4th
„ September,	„	19·7	„ { 16th and 28th }	„	24·7	„ 12th
„ October,	„	15·5	„ 31st	„	21·1	„ { 5th and 6th }
„ November,	„	13·0	„ 23rd	„	16·9	„ 3rd
„ December,	„	10·8	„ 21st	„	14·1	„ 25th.

The smallest range in the year is therefore on January 15, and the largest is on July 5.

By taking the mean of all the numbers in each column the mean monthly daily range is shown; these are the same as in the bottom line of Table XLIII., and these agreements are a proof of the general accuracy of the work.

TABLE XLII.

Showing the Greatest and Least Ranges of Temperature in every Month, as Deduced from the Observations taken at the Gardens of the Royal Horticultural Society, Chiswick, 1826-1869.

ON THE

FALL OF RAIN

DAILY, MONTHLY, AND YEARLY

AT THE

ROYAL HORTICULTURAL GARDENS
CHISWICK

FROM THE BEGINNING OF THE YEAR 1826

TO THE END OF THE YEAR 1869

THE FALL OF RAIN.

IN the Meteorological Journal of the Royal Horticultural Society, the rainfall on every day that any fell, has been carefully recorded. The rain-gauge with which the observations were at first made, is stated to have been constructed according to Mr. Howard's directions in his work upon the Climate of London (see vol. vii. of the 'Transactions of the Society,' page 100), and the following description is extracted from that work :—

HOWARD'S RAIN-GAUGE.

'The rain-gauge consists of three pieces, a funnel, a bottle, and the measure. The funnel is most conveniently made of five inches opening, and of the form represented in the figure: the mouth-piece of brass, turned in a lathe, the remainder of tinned copper. It has two necks: the inner and longer one, widening a little downwards, enters deep into the bottle, and conveys the rain: the outer neck is soldered on the cone of

the funnel, having no opening into the latter: it serves the necessary purpose of preventing the entrance of water from the outside; and by resting on the shoulder of the bottle, it gives steadiness to the funnel.

'As to the bottle, a common wine-quart will contain from two to two and a half inches of rain on this funnel: but it is better to use a three-pint bottle (technically termed a Winchester-quart), which has the proportions given in the figure. For an unusual fall of rain may happen, when a previous quantity has not been measured out; and it is on such occasions that we would wish, more especially, to be certain of the amount.

'A cylindrical glass of the depth of eight inches, exclusive of its foot, and $1\frac{1}{3}$ inch in diameter, serves to make the measure. It is graduated into parts, each of which is equal in capacity to the depth of $\frac{1}{100}$ of an inch on the area of the mouth of the funnel. A glass of the above size will measure out fifty such parts, or half an inch at once. The graduation is conducted on the principle (which is a medium between calculation and experiment) that a cylinder of water at a mean temperature, an inch deep, and five inches in diameter, weighs 10 ounces troy. The hundredth part of this, or 48 grains, is accordingly taken for the graduating quantity, and the scale is formed by successive additions, at each of which the surface is marked. Considering the nature of this operation, which scarcely admits of our going to fractions of a grain, I suppose the above standard to be sufficiently correct. I have been accustomed to etch the scale on the glass with fluoric acid, but it is more conspicuous when engraved at the glass-cutter's wheel. Previously to sending it for this purpose, the whole scale should be traced, either on a strip of paper pasted on before it is divided, or in oil paint on the glass itself. A diamond, or steel point, may be used for engraving the scale, in default of other means.'

This gauge was not in use lately, but when changed I cannot find any record.

The first step in this investigation was to form Tables precisely similar to those for the temperature of the air, showing at a glance the daily falls of rain on the same day of the year, throughout the series of forty-four years, and in this way Tables I. to XII. were formed.

TABLE I.

Showing the Fall of Rain on every day in January during the years 1826-1869 at the Gardens of the Royal Horticultural Society at Chiswick.

A glance at these Tables shows in every month the periods of long-continued absence of rain, and of long periods of continuous rain.

The following are instances of very little or no rain for a fortnight together or more :—

In January,	1826, 1827, 1829, 1830, 1838, 1850, 1861.
„ February,	1827, 1855, 1858, 1862.
„ March,	1828, 1829, 1847, 1850, 1858.
„ April,	1826, 1834, 1840, 1842, 1852, 1855, 1861, 1863, 1864.
„ May,	1829, 1833, 1834, 1836, 1838, 1848, 1866.
„ June,	1826, 1835, 1842, 1846, 1849, 1865, 1867, 1868.
„ July,	1827, 1832, 1835, 1860, 1863, 1866, 1869.
„ August,	1826, 1833, 1834, 1835, 1853, 1857, 1864, 1869.
„ September,	1832, 1846, 1850, 1851, 1865, 1868.
„ October,	1828, 1842, 1845, 1868.
„ November,	1844, 1851, 1858, 1859, 1862, 1867.
„ December,	1829, 1834, 1835, 1838, 1840, 1844, 1851, 1853, 1855, 1859, 1861, 1864, 1865.

Thus there have been in the forty-four years—

7 such instances in January.	7 such instances in July.
4 „ February.	8 „ August.
5 „ March.	6 „ September.
9 „ April.	4 „ October.
7 „ May.	6 „ November.
8 „ June.	13 „ December.

The month in which long periods without rain have been most frequent is December, and those in which long periods have been least frequent are February and October.

The longest intervals without rain in each month are as follows :—

In January,	1838	26 days.
„ February,	1827	24 „
„ March,	1829	27 „
„ April,	1834	24 „
„ May,	1833	28 „
„ June,	1865	24 „
„ July,	1869	27 „
„ August,	1864	19 „
„ September,	1865	19 „
„ October,	1842	17 „
„ November,	1867	25 „
„ December,	1829	28 „

Of periods of 14 days or more without rain running from one month into another, and therefore in addition to the above instances, there are 24; the largest of these is 32 days in 1846, May 21 to June 21; the next in order is 30 days in 1826, June 8 to July 7, and 1850, February 21 to March 22.

The following are instances of long-continued rain, or rain falling every day for a fortnight together :—

In January,	1834 and 1846.
„ February,	1833.
„ March,	1836.
„ April,	1829 and 1867.
„ May,	1843.
„ June,	1852, 1860, 1862.
„ July,	1867.
„ August,	1832 and 1860.
„ September,	1829, 1830, 1835, 1860, and 1866.
„ October,	1836, 1841, 1846, 1848, 1855, 1865.
„ November,	1842, 1852.
„ December,	1827, 1833.

Thus, once only in the four months of February, March, May, and July has rain fallen consecutively for so long a period as 14 days. Of the remaining months there are five distinguished by two such cases in 44 years, viz., January, April, August, November, and December, and there are three such cases in June, five in September, and six in October.

Of other instances of 14 days or more of continuous rain running from one month into the next, there are seven cases, viz., in 1836, March 22 to April 9; 1843, May 14 to June 10; 1836, September 27 to October 15; 1841, September 21 to October 18; 1855, September 28 to October 17; 1840, October 26 to November 13; and 1841, November 26 to December 13. Of these the longest continuous rain was 28 days.

In looking over Tables I. to XII. it will be seen how, as a rule, the rain falls in gentle showers, and but seldom as very heavy rain. Falls of an inch in the day in the winter months are very unusual; in the 44 years there has been but one such fall in the months of January, March, and December, and there has not been a single instance in the month of *February*. The greatest fall in this month on one day was on the 25th day in the year 1849, when the amount was 0·92 inch. All the instances of an inch of rain in the day in the 44 years are as follows:—

	In.		In.
January 11, 1866	1·00	July 15, 1841	1·46
March 20, 1862	1·11	„ 24, 1849	1·16
April 2, 1830	1·19	„ 1, 1851	1·18
„ 25, 1846	1·40	„ 16, 1852	1·60
May 13, 1835	1·10	„ 11, 1855	1·07
„ 5, 1843	1·26	„ 26, 1855	1·22
„ 12, 1860	1·14	„ 28, 1860	1·39
June 26, 1835	1·00	„ 25, 1867	1·48
„ 9, 1852	1·48	August 13, 1828	1·14
„ 4, 1866	1·02	„ 10, 1842	1·06
July 22, 1826	1·37	„ 3, 1843	1·03
„ 24, 1829	1·03	„ 1, 1846	1·23
„ 12, 1831	1·10	„ 31, 1848	1·31
„ 18, 1834	1·22	„ 27, 1851	1·32
„ 29, 1834	1·31	„ 17, 1856	1·12

		In.			In.
August	10, 1865	1.08	October	3, 1849	1.01
September	9, 1827	1.09	"	4, 1852	1.06
"	10, 1828	1.27	"	22, 1857	1.96
"	1, 1831	1.50	November	7, 1833	1.02
"	23, 1846	1.21	"	28, 1838	1.21
"	26, 1859	1.68	"	14, 1852	1.24
"	28, 1862	1.44	"	13, 1861	1.16
October	28, 1827	1.06	"	27, 1869	1.04
"	12, 1831	1.00	December	23, 1833	1.13
"	15, 1844	1.04			

Thus there are two instances in April; three in May; three in June; thirteen in July; eight in August; six in September; six in October; and five in November.

The heaviest fall of all is 1.96 in. in *October*, 1857.

By taking the sums of all the numbers in Tables I. to XII., month by month, Table XIII. was formed, showing the monthly fall of rain for 44 years; and by taking the sums of all the numbers, day by day, Table XIV. was formed, showing the sums of every fall of rain on every day of the year for 44 years: and by taking the sums of the numbers in Tables XIII. and XIV. the accuracy of all this work is proved.

By looking over Table XIII. month by month we see that—

		In.
In January,	1855, the fall of rain in the month was as small as	0.10
" "	1866, " "	large as 3.72
" February,	1832, " "	small as 0.23
" "	1833, " "	large as 3.98
" March,	1850, " "	small as 0.13
" "	1862, " "	large as 3.74

" "	1852, " "	large as 6.20
" December,	1829, " "	small as 0.15
" "	1868, " "	large as 4.86

Therefore, the smallest monthly fall of rain, viz., 0.06 in., took place in April, 1840, and the largest, 6.34 in., in July, 1834.

TABLE XIII.

Showing the Monthly Fall of Rain in Forty-four Years (1826-1869 inclusive).

Year	JANUARY	FEBRUARY	MARCH	APRIL	MAY	JUNE	JULY	AUGUST	SEPTEMBER	OCTOBER	NOVEMBER	DECEMBER	SUMS
1826	0.27	1.71	1.62	0.88	2.39	0.38	2.07	2.00	3.71	2.14	2.89	1.77	21.83

By taking the means of the numbers in each month for all the years, the average fall of rain for each month is as follows:—

	<i>At Chiswick.</i>							<i>At Greenwich.</i>						
	In.							In.						
January	1·70	1·87
February	1·45	1·57
March	1·37	1·59
April	1·51	1·73
May	1·96	2·17
June	1·99	1·94
July	2·32	2·56
August	2·41	2·39
September	2·50	2·43
October	2·63	2·77
November	2·10	2·36
December	1·53	1·96

Greenwich averages are for fifty-five years, viz. 1815–1869.

The following Table shows the yearly fall of rain in each year in the period 1826–1869 at Chiswick and at Greenwich for the same years:—

<i>Year.</i>	<i>Chiswick.</i>							<i>Greenwich.</i>						
	In.							In.						
1826	.	.	.	21·8	.	.	.	23·0
1827	.	.	.	22·4	.	.	.	24·9
1828	.	.	.	27·9	.	.	.	31·5

1848	.	.	.	28·8	.	.	.	30·2
1849	.	.	.	22·8	.	.	.	23·7
1850	.	.	.	18·3	.	.	.	19·7
1851	.	.	.	20·8	.	.	.	22·7
1852	.	.	.	32·6	.	.	.	34·2

<i>Year.</i>	<i>Chiswick.</i>						<i>Greenwich.</i>
			In.				In.
1853	.	.	24.4	.	.	.	29.0
1854	.	.	18.9	.	.	.	18.7
1855	.	.	24.4	.	.	.	21.1
1856	.	.	22.7	.	.	.	22.2
1857	.	.	21.1	.	.	.	21.4
1858	.	.	15.8	.	.	.	17.8
1859	.	.	25.5	.	.	.	25.9
1860	.	.	30.1	.	.	.	32.0
1861	.	.	19.5	.	.	.	20.3
1862	.	.	26.5	.	.	.	26.5
1863	.	.	20.3	.	.	.	19.8
1864	.	.	16.9	.	.	.	16.8
1865	.	.	26.9	.	.	.	28.6
1866	.	.	29.0	.	.	.	30.1
1867	.	.	22.2	.	.	.	28.5
1868	.	.	19.3	.	.	.	25.2
1869	.	.	21.7	.	.	.	24.0

The years distinguished by the smallest annual fall of rain, both at Chiswick and Greenwich, are 1847, and 1864. The least annual rainfall at Chiswick was 15.8 inches, the year 1858. The greatest annual rainfall at Chiswick was 32.6 inches, the year 1852. By comparing the falls of rain at Chiswick and Greenwich together, year by year, we see that generally the fall at Greenwich is the greater in amount, and this excess at times has continued for several years together. These instances are:—

			In.
From 1826 to 1828, the excess in 3 years was			7.3
„ 1837 to 1839,	„	3 years was	5.0
„ 1847 to 1853,	„	7 years was	12.9
„ 1857 to 1861,	„	5 years was	5.4
„ 1865 to 1869,	„	5 years was	17.3

There is reason to fear that the rainfall at Chiswick in the last three or four years has been somewhat too small in amount.

At times, however, it has been greater at Chiswick than at Greenwich. These instances are:—

The year 1829.

„ years 1832, 1833, and 1834.

„ years 1836, 1840, 1843, 1845, 1846, 1854, 1855, 1856, 1863, and 1864.

One year the amounts were the same, viz., in 1862. There are twenty-nine instances of Greenwich being in excess; and fourteen of Chiswick being in excess.

The mean at Chiswick is 23.5 inches,
and „ Greenwich is 24.5 inches,

as the annual fall of rain, as found from the observations 1826 to 1869.

By comparing the numbers in Table XIV. month by month we see that :—

		In.			In.
In January the sums vary from		0·86 on the	8th to	4·80 on the	12th
„ February	„ „	0·88	„ 6th	„ 4·18	„ 26th
„ March	„ „	0·84	„ 26th	„ 3·89	„ 14th
„ April	„ „	1·08	„ 19th	„ 3·98	„ 25th
„ May	„ „	1·48	„ 18th	„ 4·36	„ 5th
„ June	„ „	1·20	„ 8th	„ 4·83	„ 12th
„ July	„ „	1·04	„ 2nd	„ 4·81	„ 23rd
„ August	„ „	1·58	„ 28th	„ 6·05	„ 17th
„ September	„ „	1·69	„ 5th	„ 6·19	„ 28th
„ October	„ „	1·25	„ 13th	„ 6·33	„ 22nd
„ November	„ „	1·60	„ 20th	„ 5·17	„ 28th
„ December	„ „	0·91	„ 10th	„ 3·42	„ 7th

By taking the differences between these extremes in each month, we find that the smallest difference is in December, viz., 2·51 in., and the largest in October, viz., 5·08 in.

By comparing the consecutive numbers in Table XIV. together very large differences are found, the largest of these in each month are as follows :—

				In.
In January between the		10th and 11th days,	the difference is	2·65
„ February	„ 26th	„ 27th	„ „	2·28
„ March	„ 14th	„ 15th	„ „	2·17
„ April	„ 25th	„ 26th	„ „	2·78
„ May	„ 29th	„ 30th	„ „	2·63
„ June	„ 5th	„ 6th	„ „	3·20
„ July	„ 1st	„ 2nd	„ „	3·05
„ August	„ 12th	„ 13th	„ „	3·91
„ September	„ 25th	„ 26th	„ „	4·22
„ October	„ 17th	„ 18th	„ „	3·80
„ November	„ 20th	„ 21st	„ „	2·83
„ December	„ 23rd	„ 24th	„ „	1·53

By comparing the amounts of the falls at different periods of the year, it is at once seen that the heaviest take place in the months of May to November, and the lightest in the early months of the year. The day in the year distinguished by the smallest fall is March 26, with 0·84 in. for 44 years, the next in order being January 8 and February 6. The day distinguished by the heaviest fall of the year is October 22, with 6·33 in. as the sum for 44 years; the next in order are September 28 and September 26, with 6·19 in. and 6·09 in. respectively.

By taking the sums of the numbers in Table XIV. in five-day periods

Table XV. was formed. On looking over this Table, we still find considerable differences in every month of the year, and that the sum of five-day periods vary.

		In.			In.

									" 27-31	.	9-35

The sums of the falls of rain in five day-periods, therefore, exhibit very considerable differences in every month; the smallest is in December, viz., 2·26 in., and the largest is in October, 9·24 in.; they are also large in January, July, and August.

The mean difference of the four months January, July, August, and October is 7·63 in., and of the remaining eight months is 4·35 in.

The five-day period distinguished by the least rain in the year is from March 22 to 26; and that by the greatest is October 23 to 27; the difference between the two amounts is 15·45 in 44 years.

By taking the numbers in Table XIV. in successive ten-day groups the next Table was formed.

TABLE XVI.

* *Showing the Sum of Rainfall in Ten-day Periods.*

January 1-10 . . .	19·72	June 30 to July 9 . . .	26·70
„ 11-20 . . .	29·67	July 10-19 . . .	34·19

May 1-10 . . .	29·83	October 28 to November 6	32·55
„ 11-20 . . .	25·39	November 7-16 . . .	28·85
„ 21-30 . . .	27·98	„ 17-26 . . .	29·91
May 31 to June 9 . . .	28·63	November 27 to December 6	30·16
June 10-19 . . .	30·47	December 7-16 . . .	22·45
„ 20-29 . . .	28·15	„ 17-26 . . .	21·88

The differences between these numbers are at times great; in January the sum, in the first ten days is less than in the second by 10·0 in. From this time the differences are generally small, with the exception of that between the period ending July 9 and that ending July 19, which is 7·5 in., till between the ten-day period ending October 17 and that ending October 27, the difference being 10·7 in., and also between

the period ending October 27 and that ending November 6, the difference on this occasion being 10·9 in., this also being the largest difference in the year.

The period of least changes, generally, between consecutive ten-day periods, extends from July 19 to October 7; but the driest ten-day period, however, does not occur in this interval, it being from March 22 to 31; the next in order is March 2 to 11, and then February 10 to 19.

The wettest period of ten consecutive days in the year is from October 18 to 27. The other periods of large falls are August 9 to 18, August 19 to 28, and September 18 to 27.

It is worthy of notice that both the driest and wettest decades are coincident in date with those as found in the reduction of the Greenwich observations.

By taking the sums in fifteen-day periods the next Table was formed.

TABLE XVII.

Showing the Sum of Rainfall in Fifteen-day Periods.

January 1-15 . . .	36·29	June 30 to July 14 . .	41·62 .
„ 16-30 . . .	36·68	July 15-29 . . .	56·25
January 31 to February 14	34·30	July 30 to August 13 .	55·02
February 15 to March 1 .	33·66	August 14-28 . . .	48·64
March 2-16 . . .	31·08	August 29 to September 12	52·84
„ 17-31 . . .	26·84	September 13-27 . .	53·64
April 1-15 . . .	33·26	September 28 to October 12	56·21
„ 16-30 . . .	33·35	October 13-27 . . .	57·31
May 1-15 . . .	43·82	October 28 to November 11	46·59
„ 16-30 . . .	39·38	November 12-26 . .	44·72
May 31 to June 14 . .	45·04	November 27 to December 11	41·50
June 15-29 . . .	42·21	December 12-26 . .	32·99

The differences between these numbers are occasionally large. Between the periods ending April 30 and May 15 the difference is 10·5 in.; between those ending July 14 and July 29, 14·6 in.; and between those ending October 27 and November 11, 10·7 in.

The fifteen-day period of least rain is from March 17 to 31, and the next in order is from March 2 to 16.

The period of most rain is October 13 to 27, and the next in order is July 15 to 29, and September 28 to October 12.

By taking the sums of rain in successive periods of thirty days, we find that the sum—

				In.
From January	1st to January	30th	was	72·97
„ „	31st „ March	1st	„	67·96
„ March	2nd „ „	31st	„	57·92
„ April	1st „ April	30th	„	66·61
„ May	1st „ May	30th	„	83·20
„ „	31st „ June	29th	„	87·25
„ June	30th „ July	29th	„	97·87
„ July	30th „ August	28th	„	103·66
„ August	29th „ September	27th	„	106·48
„ September	28th „ October	27th	„	113·52
„ October	28th „ November	26th	„	91·31
„ November	27th „ December	26th	„	74·49

From this we see that the period of thirty consecutive days of least fall of rain is from March 2 to 31, and of the greatest, from September 28 to October 27.

By taking the sums of the amounts of rain which fell on every day, in periods of sixty days, we find that the sum—

				In.
From January	1st to March	1st	was	140·93
„ March	2nd „ April	30th	„	124·53
„ May	1st „ June	29th	„	170·45
„ June	30th „ August	28th	„	201·53
„ August	29th „ October	27th	„	220·00
„ October	28th „ December	26th	„	165·80

The period of least fall of sixty days' duration was from March 2 to April 30, and of the greatest from August 29 to October 27.

Again, by taking periods of successive ninety days, we see that the sum—

				In.
From January	1st to March	31st	was	198·85
„ April	1st „ June	29th	„	237·06
„ June	30th „ September	27th	„	308·01
„ September	28th „ December	26th	„	279·32

But the sum of the falls in the ninety days from January 31 to April 30, was 192·5 in., being smaller than in the period from January 1 to March 31; and the sum of the falls in the ninety days September 8 to December 6, was 309·3 in., being larger than in the ninety days June 30 to September 27.

Taking successive periods of 120 days, the sums of the falls are:—

				In.
From January	1st to April	30th	was	265·46
„ May	1st „ August	28th	„	371·98
„ August	29th „ December	26th	„	385·80

But these sums do not represent the 120 days of greatest rain, the sum of the falls from July 30 to November 26 being 415·0 in.; and that from June 30 to October 27 is 421·5 in., which represents the greatest in the year.

Collecting together the several periods of least rain, we find that—

The	5-day period of least rain was from	March	22nd	to	March	26th
„	10	„	„	„	22nd	„ „ 31st
„	15	„	„	„	17th	„ „ 31st
„	30	„	„	„	2nd	„ „ 31st
„	60	„	„	„	2nd	„ April 30th
„	90	„	„	January	31st	„ „ 30th
„	120	„	„	„	1st	„ „ 30th

Thus, all the periods of least falls of rain take place within the first 120 days of the year.

In like manner, collecting the periods of heaviest falls, we find that:—

The	5-day period of heaviest rain was from	October	23rd	to	October	27th
„	10	„	„	„	18th	„ „ 27th
„	15	„	„	„	13th	„ „ 27th
„	30	„	„	September	28th	„ „ 27th
„	60	„	„	August	29th	„ „ 27th
„	90	„	„	July	30th	„ „ 27th
„	120	„	„	June	30th	„ „ 27th

Thus, all the periods of heaviest rains take place in the period from June 30 to October 27.

By taking the means of the numbers in Table XIV. in each month, we find that the average sums of the falls of rain in 44 years:—

In	January	2·45	inches	per	day
„	February	2·24	„	„	
„	March	1·94	„	„	
„	April	2·22	„	„	
„	May	2·78	„	„	
„	June	2·91	„	„	
„	July	3·30	„	„	
„	August	3·41	„	„	
„	September	3·67	„	„	
„	October	3·73	„	„	
„	November	3·08	„	„	
„	December	2·17	„	„	

And by dividing these numbers by 44, we find the average fall per day in each month as follows:—

In	January	·056	inch	per	day
„	February	·051	„	„	
„	March	·044	„	„	

Diagram showing the amount of Rainfall at Chiswick in successive Periods of ten days
from all the years 1826 to 1869.

Spottiswoode & Co. Lith. London.

Note. The first point in the curve shows the total amount of rain which fell in 44 years, between Jan'y. 1 and Jan'y. 10, and the second point that of the second 10 days and so on for successive periods of 10 days.~

In April	·050 inch per day
„ May	·063 „ „
„ June	·066 „ „
„ July	·075 „ „
„ August	·078 „ „
„ September	·083 „ „
„ October	·085 „ „
„ November	·070 „ „
„ December	·049 „ „

The average rainfall in the first 120 days, being those of least rain, is 0·05 in. per day; and in the period, June 30 to October 27, being those of the greatest rain, is 0·08 in. per day.

By taking the sums of the falls of rain in the several periods of least and greatest falls, and dividing the sums by the numbers as follows :—
in the

		In.		In.
5 days of least falls	the sum was	7·65	or, per day,	1·53
10	„ „	17·84	„	1·78
15	„ „	26·84	„	1·79
30	„ „	57·92	„	1·93
60	„ „	124·53	„	2·08
90	„ „	198·85	„	2·21
120	„ „	265·46	„	2·21

and of

		In.		In.
5 days of greatest falls	the sum was	23·10	or, per day,	4·62
10	„ „	43·45	„	4·35
15	„ „	57·31	„	3·82
30	„ „	113·52	„	3·78
60	„ „	220·00	„	3·67
90	„ „	308·01	„	3·42
120	„ „	421·53	„	3·51

If we divide the numbers in the last column by 44, we find that the average fall per day in the

		In.		In.
5 days of least rain was		·035,	and of the greatest was	·105
10	” ”	·040,	” ”	·099
15	” ”	·041,	” ”	·087
30	” ”	·044,	” ”	·086
60	” ”	·047,	” ”	·083
90	” ”	·050,	” ”	·078
120	” ”	·050,	” ”	·080

Laying down the results as found by the ten-day period, the diagram opposite shows the general run of the rainfall for the year.

The minimum, as observed, appears between the 80th and 90th days of the year, and the maximum between the 290th and 300th days, and these are the same days as found at Greenwich.

By drawing a line through the curve, giving equal weight to every point, the dotted curved line is drawn: if we consider this to represent the annual march of the fall of rain, it seems that the minimum is from the 80th to the 90th days; that it increases gradually, but with checks, to a maximum about the 220th day, decreases a little after this, attains the maximum between the 290th and 300th days; then rapidly decreases towards the end of the year, when a secondary minimum takes place, and increases to a winter maximum about the middle of January, agreeing in all its main characters with the results as found at Greenwich from fifty-five years' observations.
